Inline field multiplexer, complete with accessories (connector and labeling field), transmission of very remote signals without configuration

Product description

A field multiplexer system is a simple system for transmitting signals between two remote stations. It has a modular structure and is designed to reduce conventional parallel cabling. A field multiplexer system consists of two identical field multiplexer stations. The field multiplexer exchanges data with the remote station via a remote bus cable. The field multiplexer is the central unit of a field multiplexer station. All the necessary Inline I/O terminals of a station are connected to the field multiplexer.

Your advantages

- Remote bus connections in copper technology (can be operated via fiber optics using an interface converter as an option)
- A field multiplexer station can be supplied with all of the required 24 V voltages
- Floating alarm output (“N/C” relay contact) for connecting alarm signals
- Up to 63 I/O terminals can be connected
- Up to 512 digital or 32 analog I/Os (or a mixture) can be connected
- Connection establishment and comparison of the I/O configuration of both stations

Electrical properties

Maximum power dissipation for nominal condition	3 W
Protective circuit	Surge protection (segment supply, main supply, field multiplexer supply); Input protective diodes (can be destroyed by permanent overload)Pulse loads up to 1500 W are short circuited by the input protective diode.
	Protection against polarity reversal (segment supply/main supply); Parallel diodes for protection against polarity reversal; in the event of an error the high current flowing through the diodes causes the fuse connected upstream to blow.
	Protection against polarity reversal (field multiplexer supply); Serial diode in the lead path of the power supply unit; in the event of an error only a low current flows. In the event of an error, no fuse trips within the external power supply unit.
